

Mixto CO2 Laser Resurfacing / Follow-Along

Best for: Photo-Aging, Fine Lines & Wrinkles, Acne Scars
Down-time: ~ 7 Days

Before Procedure: Laser resurfacing will help to correct sun spots and fine to deep lines around the eyes.

1 Day After Procedure: One day after the procedure the skin is red and at it's most swollen. The patient has no pain or discomfort.

2 Days After Procedure: The swelling has reduced and the skin is starting to shed.

3 Days After Procedure: With hourly Aquaphor applications, most of the shedding skin has come off revealing pink skin underneath.

6 Days After Procedure: Much of the swelling and redness has gone down. Areas that needed more correction and received more aggressive treatments are pink and slightly more swollen than the rest of the skin.

10 Days After Procedure: The pink skin around the eyes, mouth and between the eyebrows is slowly fading and swelling in the areas is nearly resolved.

3 Months After Procedure: A significant reduction in the lines around the upper eyelids and around the mouth and most of the sun spots have been eliminated. For the remaining sun spots a series of photo facial treatments will further improve the appearance of the dark spots.
